EDUCATION

University of Kansas

Bachelor of Computer Science

Expected Graduation: May 2027

Kansas City

- Dean's List Honor Roll — **GPA: 4.0**
- Courses: Data Mining and Management, Data Science and A.I, Software Engineering, Calculus, Probability and Statistics.

WORK EXPERIENCE

Energy Transfer

May 2026 — Current

Power Marketing Analyst Intern

- Developed custom analytics platforms, interactive dashboards, and automated reporting tools supporting proprietary trading across the **ERCOT, PJM, MISO, and SPP** wholesale electricity markets.
- Built short and long-term forecasting models for nodal prices, forward power prices, load, and generation mix using weather and historical market data to support speculative trading decisions.

Outlier AI

June 2024 — March 2025

AI Mathematics Analyst

- Designed and authored advanced **algebra, calculus, and statistics** questions to train and evaluate advanced LLMs, guiding them through multi-step reasoning and reinforcement learning.
- Gained experience in **late-stage LLM training**, learning how to effectively work with and improve model outputs.

UGA Finance

January 2023 — August 2023

Software Engineer Intern

- Designed **Java** classes, triggers, and batch jobs to prepare, clean, and structure data for reporting and analytics use.
- Optimized **SQL** queries and refactored test classes, reducing deployment validation runtime by **25%**, improving overall system performance and deployment speed.

PROJECTS

Real-Time ERCOT Dashboard

Python | ClickHouse | NextJS

- Built live data feeds with normalization and validation layers that convert raw **ERCOT API** responses into clean, query-ready **ClickHouse Cloud** tables spanning nodal prices, load, and fuel mix datasets.
- Built a modular dashboard with drag-and-drop widget layouts, Mapbox **nodal price map**, and time-series visualizations connected to a central time controller for **real-time monitoring or historical exploration**.

Fullstack NFL Database

Python | SpringBoot | ReactJS | PostgreSQL

www.nfl-stathead.com

- Created a custom library that scrapes and processes large volumes of NFL data from public websites using **BeautifulSoup** and **Pandas**, transforming raw HTML into structured datasets, storing them in a **PostgreSQL** database with **SQLAlchemy**.
- Engineered a **full-stack web application (Spring Boot + React)** delivering NFL statistics through **RESTful APIs** backed by a **Supabase-hosted PostgreSQL** database, designed with modular components for maintainability and scalability.

ERCOT QSE PTP Performance Viewer

Python | PostgreSQL

- Analyzed PTP performance by QSE using hourly bid and award data, with a historical viewer showing each QSE's bidding strategy and path selection strategy relative to their matched CRR portfolio.

ACTIVITIES & LEADERSHIP

Hackathons

- Participated and led cross-functional teams at **HackKU**, **HackMidwest**, and **HackKState**, creating full-stack solutions in high-pressure environments, applying agile methodologies and collaborative problem-solving under tight deadlines.

TECHNICAL

Languages: Python, SQL, Java, Apex, C, C++, Rust, JavaScript, CSS, HTML5

Frameworks & Libraries: SpringBoot, ReactJS, NextJs, BeautifulSoup, Scikit-learn, SQLAlchemy

Tools & Platforms: PostgreSQL, ClickHouse, Salesforce, Git
